

Recommender Systems Taxonomy

Exercise 1, February 28, 2022

1 Overview

The purpose of this exercise is to find and write a short review and analyze a recommender application using a recommender systems taxonomy.

2 Learning Objectives

- To explore a wide range of recommender systems in the context of a large, professional site.
- To understand how to review a recommender-enabled site.

3 Instructions

In groups of two (2) students, choose three (3) websites from the list below. From each website define at least two different recommender techniques. You should classify each recommendation technique using the taxonomy provided in the Table 1.

List of websites/applications:

- <http://www.reddit.com/>
- <http://www.imdb.com/>
- <https://fr.zalando.ch/>
- <http://www.ebay.ch/>
- <https://www.spotify.com/> - If you already have an account.
- <https://www.netflix.com/> - If you already have an account.

Hints: Try to figure out, if those applications implement algorithms that only use generic data (nothing personalized about the users), or if they are built upon interactions between users or an user and the website/application. Don't worry about details on how they've been implemented. Try to find out recommender techniques from the first page of a web site and after some interactions with the web site (e.g., choose a particular item and add the chosen item to the cart).

Domain	news, information, products, vendors, match-making, sequences
Purpose of Recommendation	sales information, education of user/customer, build a community of users around product or content
Recommendation Context	What for recommendations are used?: users are shopping, listening music, hanging out with other people
Whose Opinion	experts, people like you
Personalization Level	generic/non-personalized, demographic, ephemeral, persistent
Privacy and Trustworthiness	low risk, medium risk, high risk
Interfaces	Types of output: predictions, recommendations, filtering Types of input: explicit, implicit
Recommendation Algorithm	non-personalized, content based filtering, collaborative filtering
